

PORTABLE DEVICE HAVING ROTATABLE DISPLAY

Abstract Of The Disclosure

5 A multi-configuration electronic device has two body portions (102, 104) that move with respect to each other, and a single display module (108). As the device is reconfigured from an open position (100) to a closed position (400), the display module rotates so that it is viewable in either of those positions. The rotation may be performed by use of a belt (802), gear and axle (1000), or a combination of belt and gear and axle (1300). The display may rotate horizontally or vertically.
